METHODS AND SYSTEMS FOR RAISING A NUMERICAL VALUE TO A FRACTIONAL POWER

ABSTRACT OF THE DISCLOSURE

A method of calculating $x^{M/N}$, x having a range and M and N integers. The range of x is partitioned into a selected number of intervals and a determination is made as to the interval into which x falls. x is normalized with a normalization factor calculated for the interval into which x falls to obtain a normalized value x' within a normalized range. A value of $x'^{M/N}$ is calculated over the normalized range and a value for $x^{M/N}$ is calculated by multiplying the calculated value of $x'^{M/N}$ by a renormalization factor calculated for the interval in which x falls.
